

# Inclined Planes

## Inclined Planes

- What forces are present on the box?

## When will it slide?

## When will it slide?

- A packing crate is placed on a  $20^\circ$  inclined plane. If the coefficient of friction between the crate and the plane is 0.65, will the crate slide down the plane?

$$\mu = \tan \theta_{\text{min}}$$

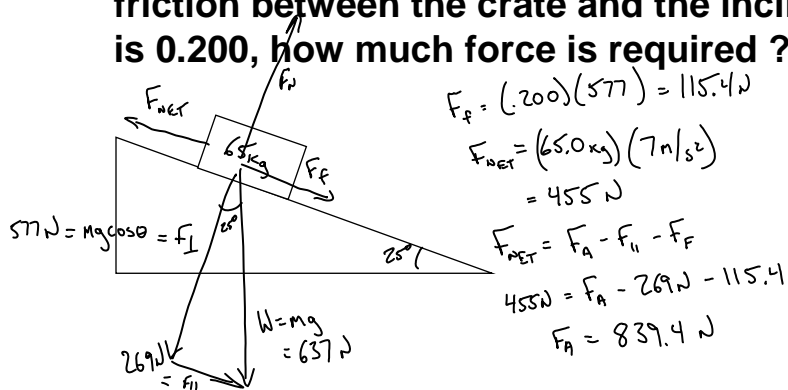

$$.65 = \tan \theta_{\text{min}}$$

$$\theta_{\text{min}} = \tan^{-1}(.65)$$

$$\theta_{\text{min}} \approx 33^\circ \Rightarrow \text{No}$$

## Inclined Plane Example

- A 65.0 kg crate is accelerated at  $7 \text{ m/s}^2$  up an incline making a  $25.0^\circ$  angle with the horizontal. If the coefficient of sliding friction between the crate and the incline is 0.200, how much force is required?
